

Process & Decision Documentation

Project/Assignment Decisions

When making the code I found I had lots of errors trying to load in the images for the background. Either the image wouldn't load or the button interactions would stop working. After some testing I realized the problem was I was preloading the images on each game state page, not before setup on the main page. To fix this on the main page I preloaded all the images into their own variables. Instead of calling them on the page itself I went to the draw function in the main code. For each if statement that called a game state I would also call the image corresponding to said state. This allowed for the image to appear without compromising the actual game play.

GenAI Documentation

No GenAI was used in this assignment.
